

## Portalify Announces New Version of Portalify TETRA IM Solution

*TETRA IM™ 1.5 Brings New Benefits to Professional and Public Safety Users*

*Helsinki, Finland – November 10, 2006 –* **Portalify Ltd**, a Finland-based software company focused on wireless data services for public safety users, today announced the latest version of Portalify TETRA IM™, a the first commercially available instant messaging (IM) solution for professional-grade communication networks.

Designed for police, fire services, and other public safety and rescue officials, TETRA IM expands the concept of talk groups into data messaging. The solution integrates TETRA users, vehicle PS users, GSM users and office PC users into a seamless communication network in which every member can receive and publish information that is relevant to their team.

The new version 1.5 of TETRA IM brings new benefits to professional-grade communication networks by automating information retrieval from backend systems on message contents, message delivery and control of message groups. The solution adds picture messaging capabilities for efficient information distribution. Dynamic groups control adds users automatically to correct message groups based on their location, status, or other information.

TETRA IM version 1.5 greatly increases the informative content of messaging by automatically finding and combining from several enterprise resources information relevant to the message contents and delivering it to users, no matter where they are. The solution also pushes important messages to office user desktops, thus ensuring delivery of critical information.

“TETRA IM 1.5 combines multi-network group communications, situation awareness tools and automated job security alerts into an integrated field communications solution, taking field operations management to the next level,” said Hannu Aronsson, Chief Technology Officer, Portalify.

TETRA IM version 1.5 has already been delivered to Finland’s Police IT Management Agency. The solution is available immediately through Portalify and its partner network.

Portalify’s TETRA IM supports TETRA, GSM/GPRS, 3G and fixed networks. Multi-channel technology complements TETRA communications with other mobile networks where necessary, thus ensuring that the information is always delivered. TETRA IM can be used with all terminal device types.

Portalify solutions enable TETRA terminals to access a wide range of data services securely and reliably. In Finland, Portalify software powers numerous key applications used daily by Finnish police officers, facilitating routine tasks and supporting efficient reporting. Other Portalify customers include public sector organizations such as safety, fire and rescue services, as well as major telecom operators and content providers.

**Note to editors:** Portalify is an exhibitor at TETRA Experience 2006 Dubai - Regional Conference, Hotel Hyatt Regency Dubai, UAE. Company executives are available for interview.

**About TETRA**

TErrestrial Trunked RAdio (TETRA) is a digital trunked radio standard developed by the European Telecommunications Standards Institute (ETSI) for highly demanding professional mobile radio applications. TETRA networks, used in over 70 countries, are built to replace a range of obsolete and insecure radio communications systems previously used by public safety and government organizations. With its unique combination of mobile phone and radio handset technology, combined with wireless data services, TETRA safeguards reliable voice and data communications for public safety officials in all situations. Versatile, instant voice and data communication to groups, as well as the prioritization of communications, are essential to field personnel and operations management in fast-moving situations. Direct handset-to-handset radio connections enable communication even without a base station network, while data services provide users with quick and direct access to key databases from their terminals.
